

December 2012 Features Update

Most of the changes made to the web-site since August have been subtle.

Field Value Warnings

In many dialogs throughout the application the value entered into each field is now checked against a pattern to detect possibly erroneous values and questionable values are highlighted in red. For example if you enter a date and misspell the month name, or enter a 5 digit year, the text in the field is displayed in red.

The screenshot shows a web application dialog for editing an individual named Jane Gilmour. The title is "Edit Jane Gilmour (12 Jan 1827 - about 8 Nov 1916)". There are buttons for "Update Individual" and "Merge". The form contains several fields: "ID:" (20107), "IDIR:" (20106), "Surname:" (Gilmour), "Given Names:" (Jane), "Gender:" (Female), "Date:" (12 Jax 1827), "Location:" (Scotland), "Christening:" (empty), and "Lived:" (1901 with Son John Dunwich, Elgin, ON, CA). The date "12 Jax 1827" is highlighted in red, indicating an invalid date. There are "Details" and "Delete" buttons for each row of data.

Illustration 1: Invalid Date in Dialog

Family Tree Enhancements

Edit Marriage Improvements

The edit marriage and edit parents dialogs are improved to save effort:

1. The preferred marriage is displayed for editing when the dialog opens, saving the need to select a marriage in the most common case where there is only one marriage.
2. All of the marriage events are now displayed for editing.
3. The name fields for the husband and wife are now editable. For the common cases where you are adding a spouse or adding the names of parents you can just fill in the name(s) and click on "Update Marriage". You will still need to edit the spouse to add any other information.
4. The dialog displayed as a result of clicking on the "Select Existing Husband" button now only includes male individuals, and that displayed as a result of clicking on the "Select Existing Wife" button now only includes female individuals. When editing parents the dialog displayed as a result of clicking on the "Select Existing Father" button now only includes male individuals whose surname is equal to that of the child or greater, and that displayed as a result of clicking on the "Select Existing Mother" button now only includes female individuals.

5. The LDS temple where the spouses were sealed to each other is now always presented in this dialog as a selection list.

Edit Event Notes

The edit dialog for the notes portion of any event is enhanced to provide additional capabilities such as: paragraph alignment, explicit font specification, font and background color, numbered and unnumbered lists, insert an image, and explicit definition of hyper-links. An example of the appearance of this enhanced field edit is shown in the next section.

Edit Name Fact

The edit dialog for a personal name fact, which pops up when you click on the Details button at the end of the Given Names input field on the Edit Individual dialog, is enhanced to permit editing all of the information about a personal name. In particular:

1. For symmetry with the other events, you can now change the surname and given name of the person from this dialog. Any changes to these fields are reflected in the main edit dialog for the individual.
2. It is now possible to add a new alternate name for the individual. Previously the alternate name(s) were displayed and could be deleted, but there was no way to add a **new** alternate name.

[Update Event](#)

Illustration 2: Edit Name Event

Edit Picture Dialog

The dialog for adding or changing an image document that is associated with a record in the family tree has been enhanced.

Input fields now conform to the standard appearance. Another enhancement is that this dialog now has pop-up help for each input field and button.

Edit Picture for Lorena Mary Gale [? Help](#)

Illustration 3: Edit Picture Dialog

Merging Individuals

The merge individuals dialog no longer displays the gender of the individuals, since in order to merge two individuals they must have the same gender. The dialog that is displayed as a result of clicking on the “Choose Second” button on the merge individuals dialog now only includes individuals whose gender matches that of the first individual, and also this list no longer includes the first individual or any individual who has previously been identified as not equivalent to the first individual. Since you are likely to want to merge with an individual who has the same name and birth date this avoids accidentally trying to merge the individual with him/herself.

Merge John Baker (about 1856 - 2 Apr 1901)

Merge Individuals			Choose Second	Do Not Ever Merge
First Individual		Second Individual		
IDIR:	45924	55541	Details	
Surname:	<input checked="" type="checkbox"/> Baker	<input type="checkbox"/> Baker

Birth Date:	<input checked="" type="checkbox"/> About 1856	<input type="checkbox"/> About 1859		
Location:	<input checked="" type="checkbox"/> Delaware, Middlesex, ON, CA	<input type="checkbox"/> Westminster, Middlesex, ON, CA		
Christening Date:	<input checked="" type="checkbox"/>	<input type="checkbox"/>		
Location:	<input checked="" type="checkbox"/>	<input type="checkbox"/>		

Illustration 4: Merge Individuals Dialog

There are two new buttons in this dialog:

1. At the top there is a “Do Not Ever Merge” button. Click this if you are very confident that the two individuals displayed below are different people. In future these two individuals will not be offered for merging.
2. The second new button is the “Details” button on the Second individual. If you are still uncertain of whether the two individuals are the same, click on this button to see the main display page for the second individual.

Edit Citation

The text and comments fields of a citation are now supported by a full function editor to provide additional capabilities such as: paragraph alignment, explicit font specification, font and background color, numbered and unnumbered lists, insert an image, and explicit definition of hyper-links. The following illustration demonstrates the use of this capability, together with the “Gravestone Photo” source to document a death. Having copied the URL of the image file onto the clipboard, usually by selecting the complete value and then pressing Ctrl-C, click on the insert image tool, which looks like a picture of a tree. This opens a dialog into which you paste the URL of the image file, by Ctrl-V, and add an option description of the image, which will be displayed if the URL becomes invalid.

This citation generates a footnote such as:

Footnotes:

1 [Marriage Register, CA, Ontario : 1899-10118](#)

2 [Gravestone Photo :](#)

3 [Birth Register, CA, Ontario : 1886-21728](#)

Illustration 6: Footnote Including Photograph

Locations

The sort order for locations containing a lot number is changed so that all of the addresses on a particular street, or within a particular concession, are presented together in order by lot number:

Locations Master List

16 Locations match the specified pattern.

Pattern:

IDLR	Location
18507	Alexander Ap't, Queens Ave, London, ON, CA
34032	Queens Ave Methodist Church, London, ON, CA
20505	Queens Ave, London, ON, CA
54210	248 Queens Ave, London, ON, CA
45975	256 Queens Ave, London, ON, CA
93449	310 Queens Ave, London, ON, CA
19362	356 Queens Ave, London, ON, CA
10377	373 Queens Ave, London, ON, CA
13813	452 Queens Ave, London, ON, CA
18443	775 Queens Ave, London, ON, CA
19636	789 Queens Ave, London, ON, CA
52568	848 Queens Ave, London, ON, CA
67289	894 Queens Ave, London, ON, CA
19477	306 Queens Ave., London, ON, CA
11559	721 Queens Ave., London, ON, CA
33372	residence of R. Jarmain, Queens Ave, London East, Middlesex, ON, CA

Illustration 7: Street Addresses In Order

As you can see from the example, this depends upon the street name being spelled exactly the same way in all cases, although case is ignored.

The display of information about a location is simplified when you do not have the authority to update the location information:

Location: Insane Asylum, London, Middlesex, ON, CA [? Help](#)

IDLR:

Location:

Short Name:

Sort Key:

FS Place Id:

Latitude: Longitude:

Preposition: Zoom:

Notes: See [Restoring Perspectives, Life and Treatment at the London Asylum.](#)

Used: Tag1: Verified:

FS Resolved: VE Resolved:

qsTag:

Illustration 8: Location Record Display

The input fields in the Location dialog now conform to the standard appearance. The notes field is a WYSIWYG text editor, which supports, as shown in the above example, the definition of hyperlinks, and also images. The FS Resolved and VE Resolved fields are now selection lists limiting input to the supported values. If the user has authority to update locations then the Notes field is a full text editor with style capabilities, otherwise the contents of the field are presented as text, which permits clicking on hyperlinks defined within the notes.

Temples

The user interface to the table which contains information about the temples of the Church of Latter Day Saints at which LDS ordinances are consecrated is improved. The locations of the temples have also been edited to make them conform to the appearance of location addresses, in particular by adding commas between the components of the temple location, and adding “USA” to the end of temple locations in the United States of America, so they are consistent with temple locations in other countries.

Temple: Toronto, ON, CA [? Help](#)

IDTR:
Code: 2 Character Code:
Location:
Opened:
Closed:
Used: Tag1:
qsTag:

Illustration 9: Dialog for Editing an LDS Temple

Forty-Six of the temples have 2 character abbreviations that were implemented by application logic in Legacy Family Tree which was copied into this site. Those 2 character abbreviations are now explicitly manipulable through the management interface. The dates on which the temple opened and closed (if relevant) are now displayed in human readable format, and may be edited by entering a date in human format. All of the input fields and buttons now have pop-up help balloons.

Addresses

The Address table provides a superset of the capabilities of the Location table. In particular it is used to represent structured postal addresses where the Location table provides only a string.

Address: General Records Office of Scotland ? Help

FS Resolved: VE Resolved: qstags:

Illustration 10: Address Record Edit Dialog

As you can see this is a much more detailed dialog than the one for editing Locations. See page 8. There are a number of enhancements:

1. The Show Map and Get Map Info buttons and the Zoom level input field are added to permit using Google maps to update the latitude, longitude, and zoom level fields using a graphical user interface.
2. The Notes field is now a text editor with the ability to set fonts, insert images, define links, and control text alignment.
3. Clicking on the Home Page text input field opens that page in a new window or tab. You are warned of this by the highlighting of the value. Note that this may be startling if you only

clicked in the field with the intention of editing the value. To avoid this click in the preceding field and then tab into the Home Page field.

4. All input fields use standard presentation on all platforms.
5. All input fields and buttons have pop-up help balloons.
6. The dialog for editing a documentary source now has the ability to create a new repository address or to find a repository address by name entered as a string, rather than only by selecting an already existing repository.

Vital Statistics

Marriage Registration

To match the existing support for birth and death registrations the marriage registration edit dialog now presents a selection list of possible matches from the family tree to the bride and groom. Also a bug in the presentation of mouse over help is corrected. If you held the mouse over the resolved link for the bride or groom an error message popped up instead of the help bubble.

Ontario: Marriage Registration Update [? Help](#)

[Previous](#) [Next](#) [New Query](#)

Identification: Year:	1904	Number:	12620	Microfilm Volume:	115

Illustration 11: Marriage Registration Edit Dialog

Census Transcriptions

The status report for each census division now also reports the progress of linking lines of the census to individuals in the family tree on a page by page basis.

1891 Census Division Status											
District 92 Middlesex South, SubDistrict A Caradoc Div 1											
Page	Done	%Done	%Linked	Transcriber	Action	Page	Done	%Done	%Linked	Transcriber	Action
1	25	100.00	4.00	jcobban	Update	2	25	100.00	84.00	jcobban	Update
3	25	100.00	24.00	jcobban	Update	4	25	100.00	80.00	jcobban	Update
5	24	100.00	0.00	jcobban	Update	6	25	100.00	0.00	jcobban	Update

Illustration 12: Progress of Linking to Family Tree

Similarly the status report for a census district not reports the progress of linking lines of the census to individuals in the family tree for each census division.

CA1881 District 167 Middlesex East Status							
<--- district 166 Oxford North							
SubDist	Div	Name	Done	Pop.	%Done	%Linked	Action
A	1	Westminster	1,607	1,607	100.00	6.41	Details
A	2	Westminster	1,051	2,925	35.37	2.02	Details
A	3	Westminster	1,655	1,655	100.00	12.45	Details
A	4	Westminster	939	1,705	54.84	0.12	Details
B	1	Dorchester North	295	1,095	26.94	0.64	Details

Illustration 13: District Status with Linking Progress

In census forms entering an invalid or very questionable value into any field is reported by setting the text color to red. This replaces a previous implementation that reported such problems only by a dialog that popped up when you tried to submit the form. Since this dialog was not always visible within the browser window this could result in an inexplicable inability to update the database.

Line	Fam	Surname	Given Names	Address	Sex	Relation	MSt
01	25	Scott	Matilda3	Pt 19 con 2	F	Wife1	M

Illustration 14: Census Fields with Questionable Values

Bug Fixes

- When editing a child from a family the options to set the relationship of the child to each of its parents now works.

- When adding any record, for example a new individual, to the database the syntax of the SQL INSERT statement now conforms to the SQL standard, rather than exploiting an extension supported only by MySQL.
- When updating any database record, including an individual or a family, the SQL UPDATE command now only sets the values of those fields that have changed since the record was last read from the database, rather than setting all fields in the record.
- In all dialogs the text input fields limit the number of characters that you can enter to the maximum number that can be stored in the database record.
- The pop-up help for each field now reports the maximum number of characters that you may enter into the field.
- When you request the addition of a new individual to the database, for example by adding a spouse, child, or parent, the actual insertion of the record into the database is deferred as late as possible to avoid doing an insert of an essentially blank record followed by an update to set all of the changed field values.
- When editing a family the “Edit” button for a spouse that is not yet created or selected is disabled until the spouse is added.
- The table for matching given names in a census record for a loose match against the table of individuals is expanded. For example “Bessie” will now match against a family tree record with given name of “Elizabeth”.
- The algorithm for matching surnames in a census record for a loose match against the table individuals is enhanced to significantly reduce the number of unlikely responses.
- The hang that occurred if you cleared the contents of an input text field that contained a location is fixed. Clearing the input field now properly returns the default, empty, location, instead of returning a selection list of **every** location in the database! Also the maximum number of matching locations that will be returned for an extremely vague location value, for example a single character, is limited to 30 to keep the application responsive.
- In the 1871 Census form setting the “Can't Read” field to on is corrected to also set the “Can't Write” field to a default of on. Note that there is at least one individual in this census who could write but not read because he had learned to write before he became blind.
- When changing the name of an individual the nominal index and marriage references are now correctly maintained.
- Many addresses which violated the convention that the rural lot number precedes the concession that it is in have been amended.
- There were a few internal tables that used the Western European character set to store text. That would have made it impossible to enter text into some fields that had characters not used by Western European countries; for example Polish, Russian, Greek, Hebrew, Japanese, Chinese, or Arabic. These tables now support the full ISO 10646 (Unicode) character set.
- No internal table yet has over a few hundred thousand entries in it. In particular there are less than 100,000 individuals defined in the family tree. However the internal key used to uniquely identify these records was originally defined as the default, a signed integer, even though

obviously there will never be any negative numbers used to identify records. All such keys have been changed to use an unsigned integer key, which permits up to 4 billion entries in each table.

- The implementation of the button on each line of a census form that invokes a search for individuals in the family tree who match the name and approximate birth year of the individual in the census is corrected to avoid getting NaN as the result when an age in months is specified. The interpretation of the age field is modified to ignore extra characters around the actual age value to permit the transcriber to, for example, enter “[43]” where the original form has left the age blank but the transcriber knows, from some other source, what the individual's age was at the time of the census. Another example is to permit the transcriber to add a question mark when the actual age is hard to decipher.
- If the first HTML element under a table cell was not a form input field, such as a text input, button, check box, or selection list, holding the mouse over the cell would result in an error message.
- The script handling the response to a query of the death registrations table did not handle SQL errors correctly. The scripts handling the response to queries of the birth, death, and marriage registration tables did not give a clear error response if the scripts were invoked with no parameters.
- I was unaware that the SOUNDEX algorithm as implemented by MySQL does not produce the same results as the SOUNDEX algorithm as implemented by PHP (which is the algorithm implemented by all other procedural languages). As a result over 1000 surnames were encoded in such a way that a vague search using the SOUNDEX algorithm would fail to find people with these surnames. The implementation has been changed to always invoke the MySQL version of the algorithm and all of the existing SOUNDEX codes in the database have been corrected.
